

4.1.3. Student Information

15:22

Write a program to read a text file containing student information (name, age, and grade) using Pandas. Perform the following tasks:

- Display the first five rows of the data frame.
- Calculate the average age of the students (limit the average age up to 2 decimal places).
- Filter out the students who have a grade above a certain threshold (consider the threshold grade is '**B**').

Note:

Refer to the displayed test cases for better understanding.

Code:

```
import pandas as pd
```

```
# Read the text file into a DataFrame
```

```
file = input()
```

```
data = pd.read_csv(file, sep="\s+", header=None, names=["Name", "Age", "Grade"])
```

```
# write your code here..
```

```
print("First five rows:")
```

```
print(data.head())
```

```
average_age=round(data["Age"].mean(),2)
```

```
print(f"Average age: {average_age}")
```

```
filtered_students=data[data["Grade"]<="B"]
```

```
print("Students with a grade up to B")
```

```
print(filtered_students)
```

Average time
0.189 s
189.00 ms

Maximum time
0.260 s
260.00 ms

✓ 1 out of 1 shown test case(s) passed

✓ 1 out of 1 hidden test case(s) passed

✓ Test case 1 **260 ms**

Expected output

Actual output

studentdata.txt
